

PLANT CELL WALL JUNCTIONS

NOTE:

- Plant cells are closely packed together without spaces between cells which helps substances move between cells.
- There are connections between cells which help keep them tightly packed.
- The cell wall is thick with a small thinner cell membrane on the inside of the cell wall.
- LOOK closely at the drawings and photographs to get an idea how to draw the packing of cells.

PLANT CELL WALL JUNCTIONS

- You cannot always see through the microscope how adjacent cell walls butt together. You can explain this in your observation.
- The cell membrane may only appear as a dark line within the cell wall.
